May 18th, 6:30 PM - 7:00 PM

Modeling cell proliferation in the transition from neurogenesis to gliogenesis

Christine Mennicke
North Carolina State University, cvmennic@ncsu.edu

Troy Ghashghaei
North Carolina State University, tghashg@ncsu.edu

Mansoor A. Haider
North Carolina State University, m_haider@ncsu.edu

Follow this and additional works at: http://scholarscompass.vcu.edu/bamm

Part of the Life Sciences Commons, Medicine and Health Sciences Commons, and the Physical Sciences and Mathematics Commons

http://scholarscompass.vcu.edu/bamm/2017/thursday/23

This Event is brought to you for free and open access by the Dept. of Mathematics and Applied Mathematics at VCU Scholars Compass. It has been accepted for inclusion in Biology and Medicine Through Mathematics Conference by an authorized administrator of VCU Scholars Compass. For more information, please contact libcompass@vcu.edu.
Modeling cell proliferation in the transition from neurogenesis to gliogenesis

In the developing brain, radial glial progenitor cells follow patterns of proliferation and differentiation to produce neurons and glia. These progenitor cells first undergo neurogenesis, producing neurons in a fairly deterministic manner, and then a portion of the cell population switches to producing glia. We explore two different ways of modeling cell divisions, branching random walks and Galton-Watson processes, particularly focusing on their application to gliogenesis. A primary quantity of interest is the number of generations of cell division required to produce \( N \) cells from a single progenitor. We develop models that systematically determine the depth of all binary trees with \( N \) leaf nodes. This information is used to estimate the number of generations of cell division in data sets tracing cell lineages in the developing mouse brain. We examine the hypothesis that cell proliferation patterns are altered as development transitions from neurogenesis to gliogenesis.
