Automotive Object Detection Training System

With the consumer’s safety always in mind, automobile companies are adding more to their systems to help detect and prevent collisions. Among these technologies is the object detection system. In summary, this system warns or reacts to oncoming objects that could put the driver in danger. As with any piece of technology, there are problems and bugs that will occur in the object detection system. In turn, this requires the availability of technicians who can troubleshoot and fix these systems. Currently, there are no systems in the market that simulate troubleshooting of object detection systems. Our Automotive Object Detection Training Simulator will provide the needed simulation to help automotive technicians learn how to troubleshoot object detection systems. Our device will be attached to a simulator that is currently on the market, the ConsuLab Light and Accessory Simulator pictured below.

Background

Our team would like to thank Melissa Gay (JSRCC) and Dr. Charles Cartin for the assistance they provided during this project. This project was funded in part, by NSF Grant ##1104190.
