May 20th, 11:00 AM - 11:30 AM

Simulating the Evolution of Skin Melanoma using Heat Transfer

Ephraim Agyingi
*Rochester Institute of Technology, eosa@rit.edu*

Follow this and additional works at: [http://scholarscompass.vcu.edu/bamm](http://scholarscompass.vcu.edu/bamm)

Part of the [Life Sciences Commons](http://scholarscompass.vcu.edu/bamm/#/comps/life), [Medicine and Health Sciences Commons](http://scholarscompass.vcu.edu/bamm/#/comps/med), and the [Physical Sciences and Mathematics Commons](http://scholarscompass.vcu.edu/bamm/#/comps/physical)

[http://scholarscompass.vcu.edu/bamm/2017/saturday/7](http://scholarscompass.vcu.edu/bamm/2017/saturday/7)

This Event is brought to you for free and open access by the Dept. of Mathematics and Applied Mathematics at VCU Scholars Compass. It has been accepted for inclusion in Biology and Medicine Through Mathematics Conference by an authorized administrator of VCU Scholars Compass. For more information, please contact libcompass@vcu.edu.
Simulating the Evolution of Skin Melanoma using Heat Transfer

Ephraim Agyingi, Tamas Wiandt and Sophia Maggelakis

School of Mathematical Sciences, RIT, NY 14623, USA

Melanoma is the most dangerous form of skin cancer. It originates from the epidermal layer of the skin and its severity determines how it evolves. Most melanomas begin by spreading horizontally within the epidermal layer before growing vertically into the dermis. We study the evolution of such a tumor by monitoring the heat profile that is generated at the surface of the skin directly above the tumor. We also investigate the effect on the steady state temperature at the skin surface of a tumor that is near large blood vessels. The model is governed by the Pennes equation.
